Hundreds of the aircraft have been targeted for grounding until their airworthiness is assured.

BY MARK LACAGNINA

n an unprecedented action, a list of Antonov aircraft that apparently are being operated in violation of requirements for continued airworthiness has been published by the International Civil Aviation Organization (ICAO).

"The primary purpose for publishing the list is to share this important safety information," said Paul Lamy, chief of ICAO's Flight Safety Section. "The action is very much in line with the organization's general policy of transparency and sharing of information, which was reinforced by the conference of directors general of civil aviation that was held in March 2006."

The conference, convened in Montreal to forge a "global strategy for aviation safety," included a presentation by Ukraine, home of the Antonov Aviation Scientific/Technical Complex (ASTC), about insufficient communication between countries in which aircraft are registered and countries in which they were designed and/or manufactured.

The presentation provided the following example: In 2004 and 2005, Ukraine's State Aviation Administration (SAA) sent information to several African civil aviation authorities (CAAs), requesting that they take action on aircraft that had been identified as unairworthy. The presentation said that because of an "insufficient level of cooperation" and communication, the SAA does not know if the requested action was taken. Moreover, the presentation said that an analysis of 10 fatal Antonov aircraft accidents in Africa in 2005 indicated that eight of the aircraft were not airworthy.

Among Ukraine's recommendations was that ICAO and its contracting states "take adequate measures to ensure an exchange of mandatory safety-related information ... and to

improve an effective control on continuing airworthiness." <sup>1</sup>

## **Biplanes Top List**

In August 2006, Antonov gave the SAA a list of 436 aircraft that it does not consider airworthy. The SAA promptly forwarded the list to ICAO and authorized the organization to publish it.<sup>2</sup>

The list includes the names of the 16 countries, all ICAO contracting states, in which the

aircraft are registered, the aircraft models, serial numbers, registration numbers, dates of manufacture, airworthiness expiration dates, and operators (see appendix, page 22).

The list includes 362 An-2s operated domestically by 35 airlines in Kazakhstan. The An-2 is a 5,500-kg (12,125-lb) biplane powered by a 746-kW (1,000-hp), nine-cylinder radial engine. Originally designed for aerial application, the aircraft first flew in 1947 and later was modified

to carry cargo or as many as 10 passengers. The SAA said that Kazakhstan's Civil Aviation Committee did not comply with ICAO requirements when it established overhaul periods allowing extension of the service lives of the An-2s registered in the country without Antonov's participation.

Also on the list are the following aircraft, which are not considered airworthy because they apparently had not been returned to

carried more

than one-third of

the passengers

transported in the

several decades. The

aircraft reportedly has

a design service life

of 30,000 hours.

**Soviet Union for** 

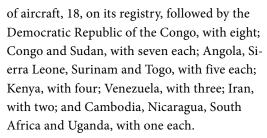

After overrunning the runway at N'Djamena, Chad, in October 2004, this An-12 reportedly was returned to service following repair of the landing gear.

Kazakhstan's
extension of
An-2 service life
without Antonov's
participation landed
362 of the workhorse
biplanes on the
blacklist.

Antonov for overhauls that were required before they reached established service-life limits:

- Twenty-seven An-12s, a four-engine turboprop freighter with a maximum takeoff weight of 61,000 kg (134,481 lb), which also can carry 14 passengers;
- Twenty-three An-28s, a 5,700-kg (12,500-lb) general-purpose twin-turboprop;
- Ten An-26s, a 24,000-kg (52,910-lb)
   pressurized short-haul twin-turboprop
   that can carry freight or as many as 40
   passengers;
- Eight An-24s, a 21,000-kg (46,297-lb) predecessor of the An-26;
- Three An-32s, a development of the An-26 for operation at high density altitudes;
- One An-8, a military transport that preceded the An-12;
- One An-72, a 33,000-kg (72,752-kg) twin-turbofan, short-takeoff-and-landing transport that replaced the An-26; and,
- One An-74, a development of the An-72 for operation in arctic regions.

In addition to the 362 An-2s, Kazakhstan's registry includes one of the An-24s on the list. Moldova has the second largest number

The airworthiness-expiration dates range from October 1991, for two An-28s in Sudan, to June 2006, for an An-12 in Congo.

#### **Communications Breakdown**

ICAO said that there was a breakdown in communications between Antonov and the Ukraine SAA, and the states of registry of the aircraft. "There is an international standard that requires the state of registry and the state of manufacture or design to communicate regularly," Lamy said.

ICAO Annex 8, Airworthiness of Aircraft, requires, for example, that states of design notify the states of registry of any information essential to the continuing airworthiness of the aircraft. The states of registry, typically through their CAAs, are responsible for ensuring that every aircraft on their registers is maintained in an airworthy condition. States of registry also are responsible for establishing the channels for communication between their CAAs and the aircraft operators in their countries, and the states of design.

ICAO believes that in some cases, the calls for action on unairworthy aircraft that were issued by the Ukraine SAA in 2004 and 2005 either did not reach the responsible parties or were ignored. Publication of the list was an effort to resolve both problems.

"Making this information public was very important because, of all the people who should have received the information, there were quite a few who did not receive it because of a breakdown in communications," Lamy said. "In a minority of cases — but we still have to take them into account — people may have chosen to look the other way. The ICAO policy on transparency and the sharing information is not to allow this kind of behavior. By making the information

public, we want to make sure that there is no possibility of looking the other way."

Annex 8 says, "Any failure to maintain an aircraft in an airworthy condition as defined by the appropriate airworthiness requirements shall render the aircraft ineligible for operation until the aircraft is restored in an airworthy condition." Accordingly, ICAO expects the aircraft on the list to be grounded by their states of registry or by other states in which they are operated until their airworthiness is assured.

## Others to Follow?

ICAO anticipates that other states of design will come forward with lists of suspected unairworthy aircraft for publication. "We are hoping that they will," said Lamy. "But you have to be aware that this situation is specific to aircraft built in states that used to be part of the Soviet Union. Service lives have been established for these aircraft; they are time-limited and have to come back to the factory every few years to be overhauled and restored to their original airworthiness conditions."

Service lives typically are not established for Western-built aircraft. Their certificates of airworthiness are maintained, in part, through on-condition maintenance and inspection, and compliance with airworthiness directives and any special conditions established for continuing airworthiness.

#### **Notes**

- Among the actions taken by the International
  Civil Aviation Organization (ICAO) in response to
  recommendations made during the conference was
  the establishment of the Flight Safety Information
  Exchange (FSIX) Web site, <www.icao.int/fsix>.
  In addition to the list of apparently unairworthy
  Antonov aircraft, the site at press time included several ICAO Universal Safety Oversight Audit Program
  reports voluntarily authorized for public release by
  states and a July 2006 report by the United Nations
  Security Council that, ICAO says, contains information on "illegal and unsafe air operations concerning
  the Democratic Republic of the Congo."
- 2. William R. Voss, president and CEO of Flight Safety Foundation, presented citations for outstanding service to Anatoly Kolisnyk, first deputy chairman of the Ukraine State Aviation Administration, and to Dmitry Kiva, general designer of the Antonov Aviation Scientific/Technical Complex, during the FSF International Air Safety Seminar in October 2006. Voss cited Kolisnyk and Kiva for "their personal commitments to safety ... by making critical airworthiness information available to states, operators and the public."

Antonov built more than 1,000 An-12 freighters for a variety of military and civil applications from 1959 through 1973. The blacklist includes 27 of the aircraft.

<sup>\*</sup> Antonov said that 362 An-2 aircraft are being operated by 35 airlines in the Republic of Kazakhstan. In accordance with Decree No. 272, dated 30 November 2005, issued by the chairman of the Civil Aviation Committee of the Republic of Kazakhstan, rules for the extension of the service life of An-2 civil aviation aircraft in the Republic of Kazakhstan have been established with respect to overhaul periods. These rules provide for procedures for extension without the participation of the aircraft designer, which runs contrary to ICAO regulatory documents.
